

# Saclay Plant Sciences LabEx Kick-Off meeting

## Projet 4 : Modelling developmental mechanisms

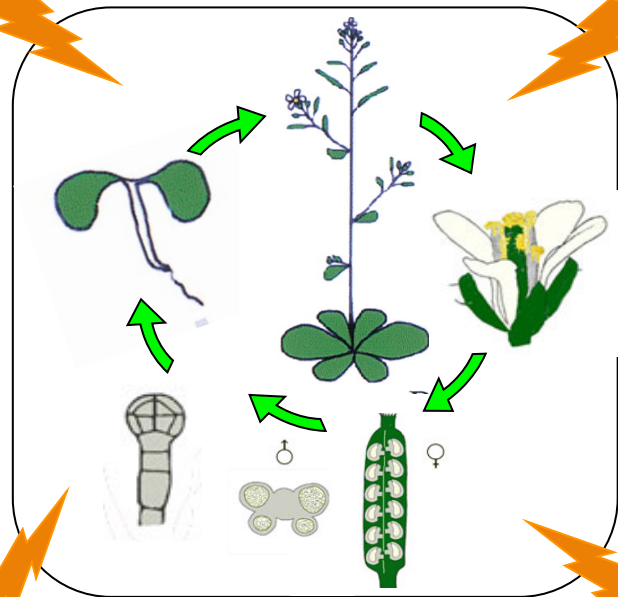

Coord : P Andrey and P Laufs

October 13, 2011

# Plant development is a plurifactoriel and integrated process

**Genome**

**Biotic factors**

**Hormones**

**Abiotic factors**

Genetic and epigenetic factors  
Resources availability  
and energetic status  
Cell-to-cell chemical signalling  
Cell-to-cell mechanical interaction  
Environmental factors

....

# How can modelling contribute to plant biology ?

- Extraction of data, representation and quantification

Fernandez et al., (2010) Nat Methods

# How can modelling contribute to plant biology ?

- Extraction of data, representation and quantification

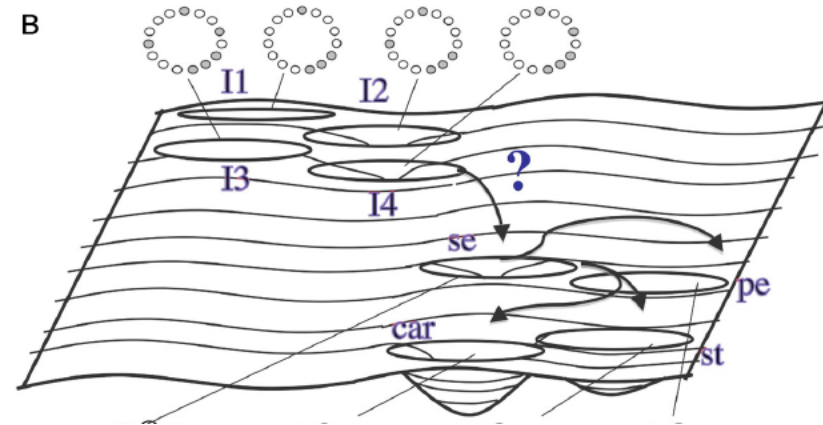

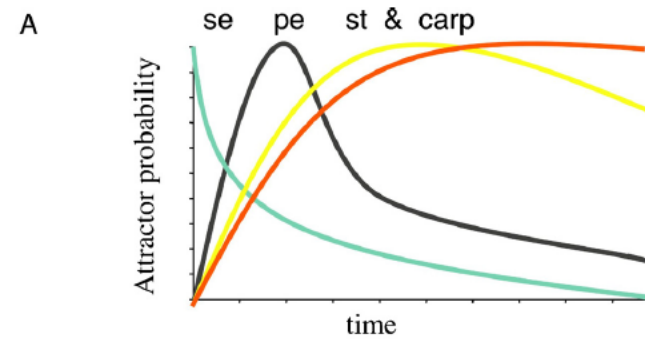

Fernandez et al., (2010) Nat Methods

# How can modelling contribute to plant biology ?

- Extraction of data, representation and quantification
- Analysis of the behaviour of complex systems

Alvarez-Buylla et al., (2010) Sem. Cell Dev. Biol.

# How can modelling contribute to plant biology ?

- Extraction of data, representation and quantification
- Analysis of the behaviour of complex systems
- Test the plausibility of different biological hypothesis

Hypothesis 1:  
*concentration based*  
"up the gradient"

Hypothesis 2:  
*flux based*  
"canalisation"

 PIN deposition

Stoma et al., (2008). PLOS Comput. Biol.

# How can modelling contribute to plant biology ?

- Extraction of data, representation and quantification
- Analysis of the behaviour of complex systems
- Test the plausibility of different biological hypothesis
- Integrate multiple scales

Interaction with  
 Other organs                      The environment

Hamant et al., (2008). Science

# The embryo : a complex structure

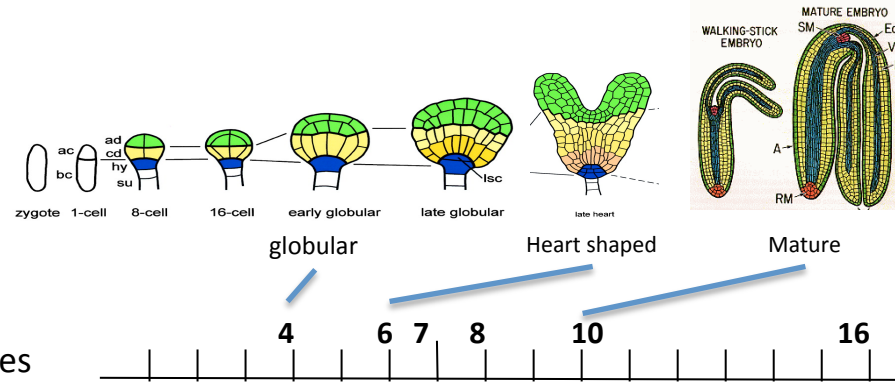

Developmental Phases

MORPHOGENESIS

MATURATION

Late M

GERMINATION

- A single cell generates a complex structure organised into different tissues
- A well-defined developmental framework
- Numerous resources available : mutants, expression patterns, transcriptomes...
- Economical importance

# Subject 1: spatio-temporal patterning of early embryogenesis

# The questions :

## Cellular basis of embryo morphogenesis

Longitudinal

Apical-Basal

Radial

Inside-Outside

Bilateral

Medio-Lateral

How are the cell divisions specified ?

How are the embryo axis determined ?

Pictures : K Belcram, JC Palauqui, B Dubreucq

# Image data

- Confocal microscopy x40

Fixed samples  
Cell wall marker : IP

Volume rendering

*Belcram K., Palauqui JC. IJPB INRA Versailles*

# Second division -> frontal plane

Asynchronous, shifted division

# Third division -> transversal plane

Front

Back

# Fourth division -> **protoderm**

Apical domain

Basal domain

# Fifth (protoderm) divisions : first in basal domain and opposed divisions

Apical domain

Basal domain

Loss of symmetry beyond 24 cells

# Image segmentation and 3D reconstructions

A. Urbain and A. Trubuil

# Subject 1: spatio-temporal patterning of early embryogenesis

- What are the determinants of the spatio-temporal pattern of cell divisions in the early plant embryo?
- > Geometrical and physical principles explaining the observed division planes?

# Phenomenological division rules

Division in two equal volumes according to

- **Hofmeister's rule**

Division orthogonally to cell elongation axis

- **Sachs' rule**

Division orthogonally to parent division plane

- **Errera's rule**

Division so as to minimize plane area

# Errera's division rule

*(Dumais, 2007)*

# Local minima of division plane area probability distribution

(Besson & Dumais, 2010)

# Subject 1: spatio-temporal patterning of early embryogenesis

- From 2D to 3D probabilistic division rules
- Influence of cell morphological constraints
- Sources of variability/robustness
- Origin of basal/apical asymmetry
- Identification of other factors/mechanisms

# Participants

- Différenciation et polarité cellulaire
  - JC Palauqui
- Modélisation et imagerie numérique
  - P Andrey, E Biot, **1 CDD (post-doc 24 months)**
- Plateforme de cytologie et d'imagerie végétale
  - K Belcram

# Subject 2: nuclear organization and transcriptional regulation of seed maturation

# The questions :

## Gene network and nuclear organisation

### ALF genes activate an embryo-specific program

Morphogenesis

Cell expansion  
Differentiation  
Storage

Dessication

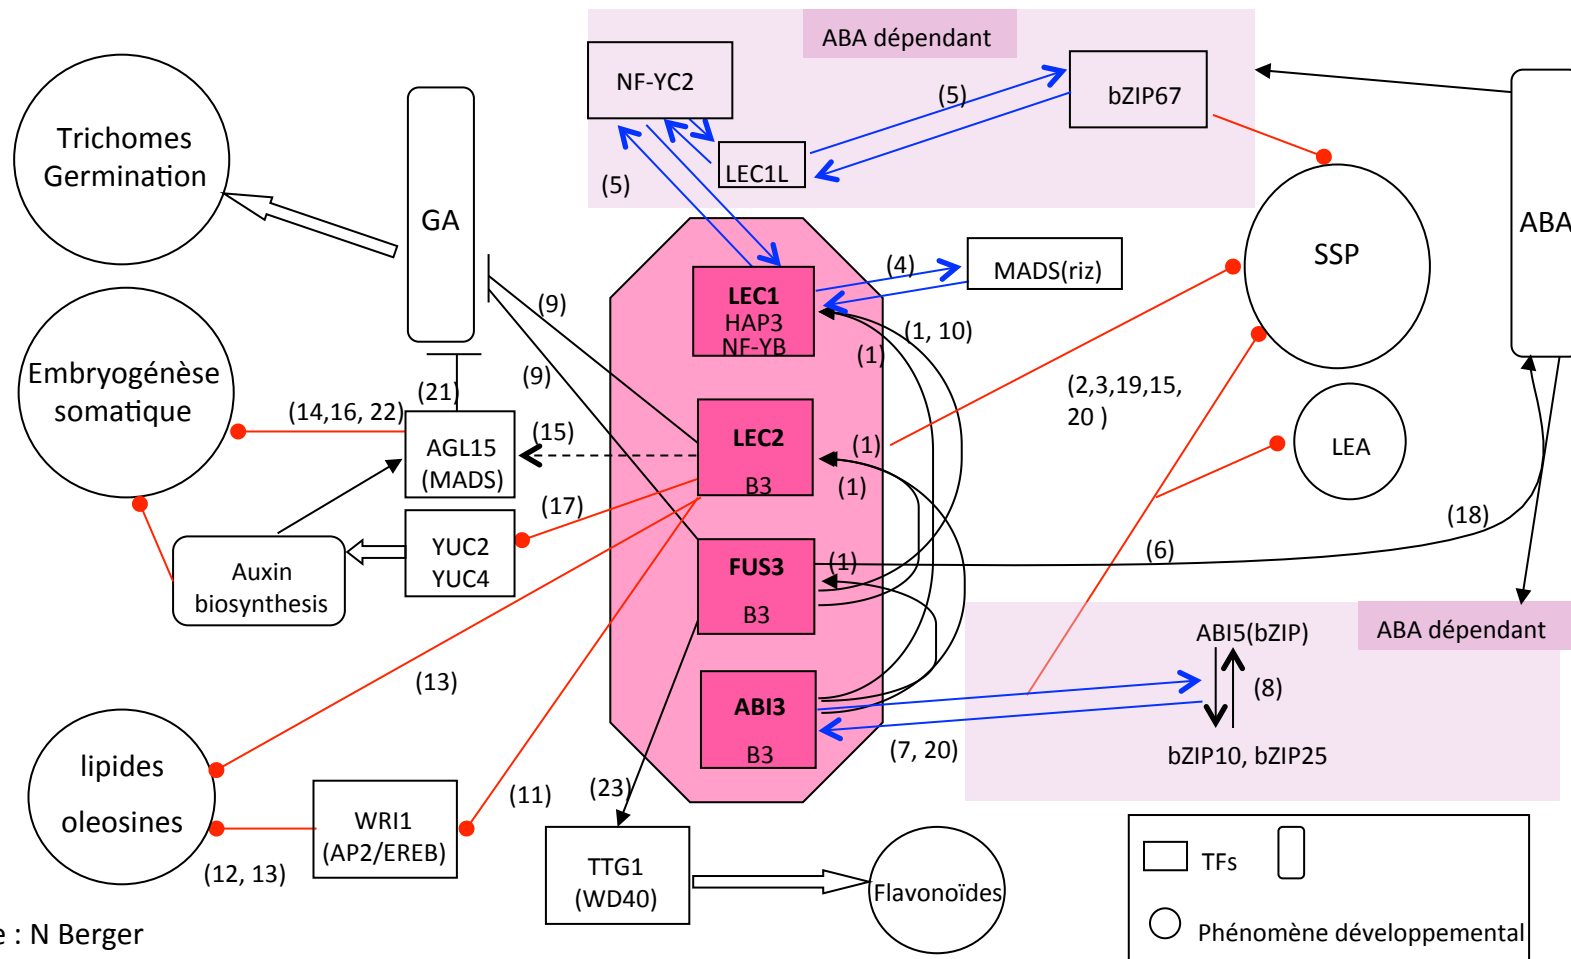

WT

# The questions : Gene network and nuclear organisation

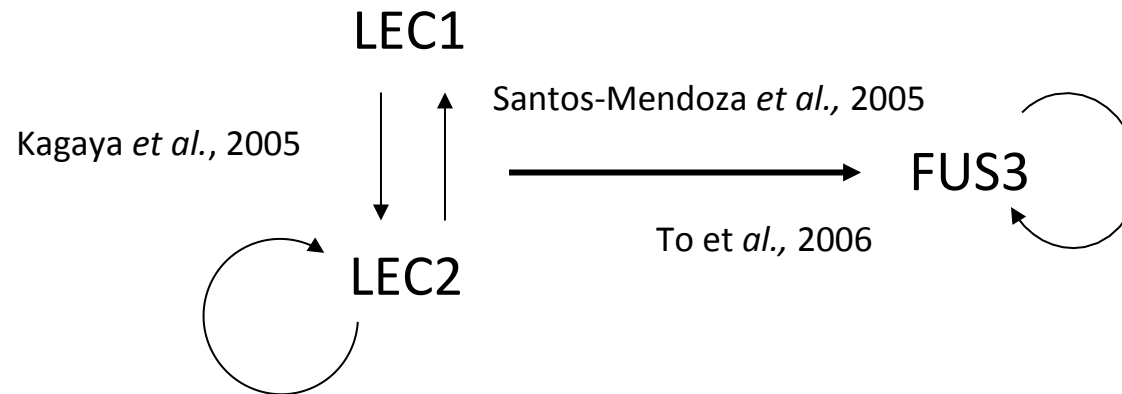

## ALF genes are at the nexus of a regulatory network controlling embryo development

Scheme : N Berger

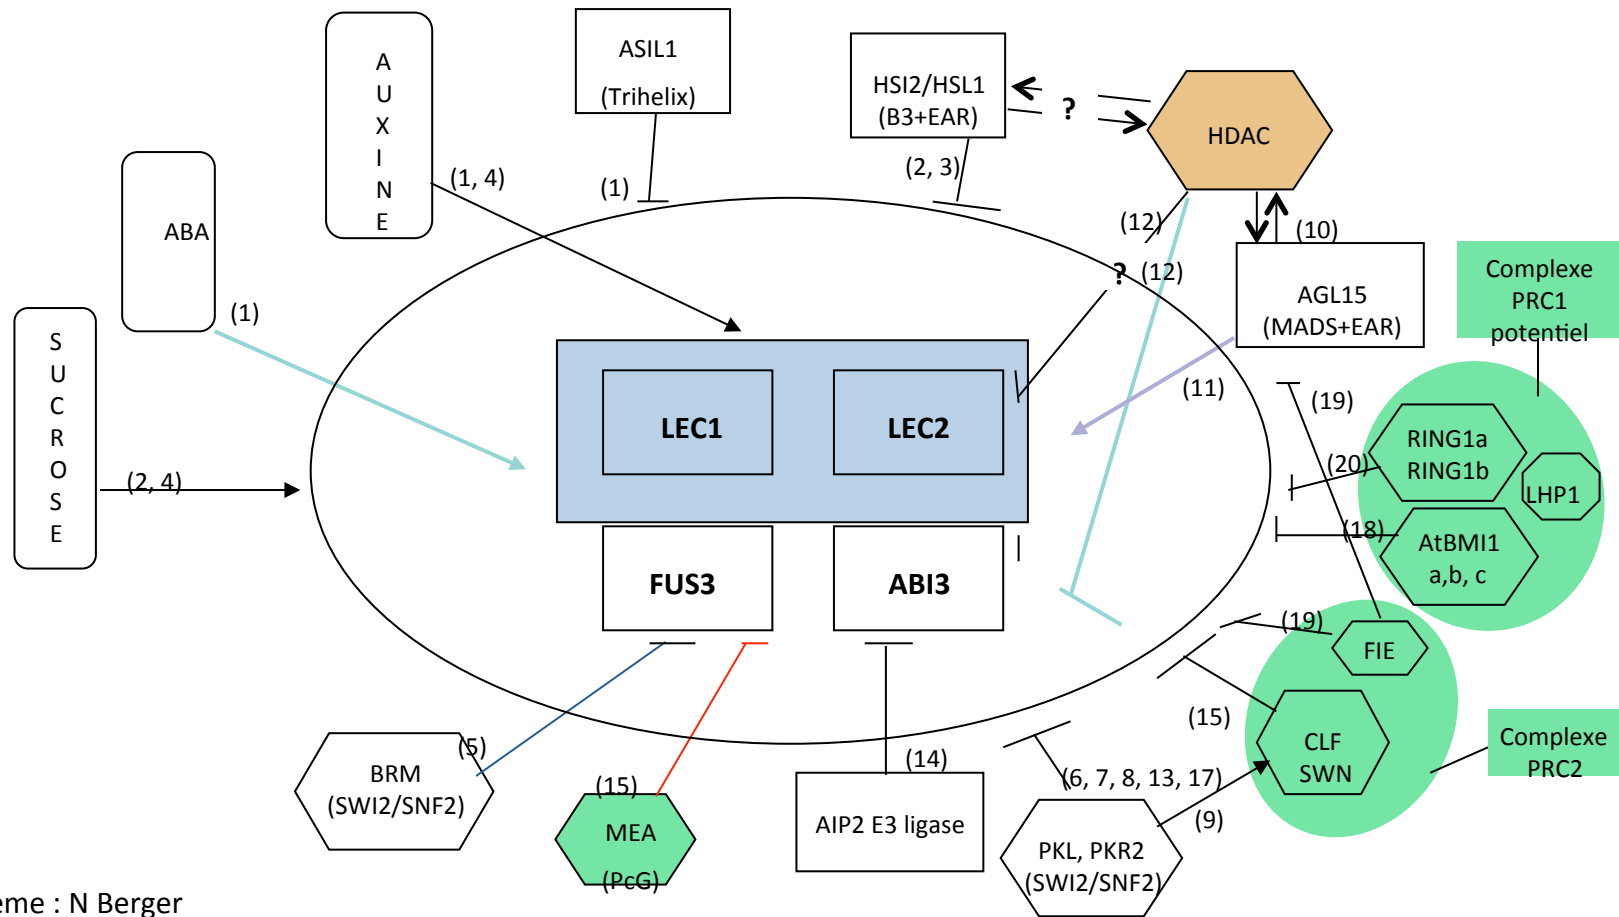

The questions :  
Gene network and nuclear organisation  
ALF genes form a core regulatory network subjected to  
external regulations

# The questions : Gene network and nuclear organisation

ALF genes form a core regulatory network subjected to external regulations

Scheme : N Berger

# The interphase nucleus, a spatially organized organelle

*(Pecinka et al, 2004)*

*(Fransz et al, 2002)*

# Nuclear organization plasticity and dynamics

(Baroux et al, 2007)

(Tessadori et al, 2007)

# Gene activity and nuclear positioning

(Meister et al., 2010)

# The questions :

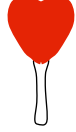

## Gene network and nuclear organisation

Is the ALF regulatory network tissue-dependant ?

Is the nuclear organisation different in embryonic and vegetative tissues ?

Is the nuclear organisation of genes linked to their expression ?

How does nuclear organisation impinge on gene regulatory networks ?

<i>LEC2</i>	<i>FUS3</i>	<i>ABI3</i>	<i>LEC1</i>
<i>pLEC2::GUS</i>	<i>pFUS3::FUS GFP</i>	ISH	ISH
			
			
			

Scheme : Mendoza et al., 2008

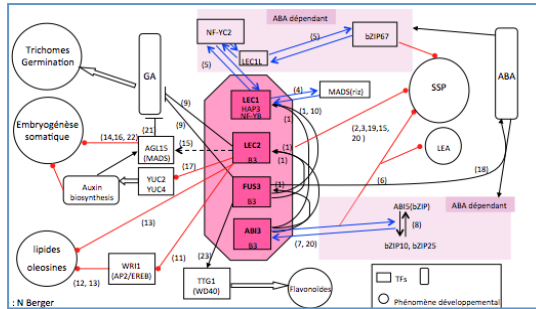

# Subject 2: nuclear organization and transcriptional regulation of seed maturation

Analysis of the dynamics of gene regulatory networks and their link with nuclear organisation during seed maturation ?

# Modelling network dynamics

## ► System state

$$S_i(t) = \begin{cases} 1 & \text{active} \\ 0 & \text{inactive} \end{cases}$$

## ► Interactions

$$w_{ij} = \begin{cases} -1 & \text{repression} \\ 1 & \text{activation} \end{cases}$$

## ► Dynamics

$$S_i(t+1) = \begin{cases} 1 & \text{if } \sum w_{ij} S_j(t) > 0 \\ 0 & \text{otherwise} \end{cases}$$

# Imaging of nucleus and genes 3D spatial organization

*(Tirichine et al., 2009)*

# Imaging of nucleus and genes spatial organization

(Tirichine et al., 2009)

# Spatial statistics and modelling of nuclear organization in 3D

(Andrey et al., 2010)

# Subject 2: nuclear organization and transcriptional regulation of seed maturation

- Mathematical modelling of transcriptional regulation networks in seed maturation
- Imaging and spatial modelling of nuclear organization and nuclear gene positions
- Integrated modelling of transcriptional regulation networks and spatial dynamics

# Participants

- Développement et qualité des graines
  - B Dubreucq
- Dynamique de la chromatine et expression génique
  - V Gaudin
- Modélisation et imagerie numérique
  - P Andrey, E Biot, 1 CDD (post-doc, 24 months)
- Plateforme de cytologie et d'imagerie végétale
  - 1 CDD (IE, 24 months)

# Expected outcomes of the project

- A multidisciplinary approach
- Towards a seed systems biology
- Better understanding of seed development
- Innovating tools to drive seed biology
- New and generic tools for plant modelling
- Foster interdisciplinary interactions in the Labex
